

# 复变函数与积分变换作业 (第2册)

班级\_\_\_\_\_学号\_\_\_\_\_姓名\_\_\_\_\_任课教师\_\_\_\_\_

## 第三次作业

教学内容: 2.1.2 柯西—黎曼方程

1. 填空:

(1) 函数  $f(z) = z \operatorname{Re} z$  的导数  $f'(z) = \underline{0}$

(2) 函数  $f(z) = z^n$  的导数  $f'(z) = \underline{nz^{n-1}}$

(3) 函数  $\frac{z-3}{(z+1)^2(z^2+1)}$  的奇点为  $\underline{-1, \pm i}$

2. 下列函数何处可导? 何处解析?

(1)  $f(z) = x^2 - yi$ ; (2)  $f(z) = 2x^3 + 3y^3i$ ; (3)  $f(z) = z^2 \bar{z}$

解: (1)  $f(z) = x^2 - yi$ , 则  $u=x^2$ ,  $v=-y$ ,

$$\frac{\partial u}{\partial x} = 2x, \frac{\partial v}{\partial y} = -1, \frac{\partial u}{\partial y} = 0, \frac{\partial v}{\partial x} = 0, \text{ 令 } \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \text{ 得, } x = -\frac{1}{2}$$

即: 在直线  $x = -\frac{1}{2}$  上可导, 复平面内处处不解析。

(2)  $f(z) = 2x^3 + 3y^3i$ , 则  $u=2x^3$ ,  $v=3y$ ,

$$\frac{\partial u}{\partial x} = 6x^2, \frac{\partial v}{\partial y} = 9y^2, \frac{\partial u}{\partial y} = 0, \frac{\partial v}{\partial x} = 0, \text{ 令 } \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \text{ 得, } \sqrt{2}x \pm \sqrt{3}y = 0$$

即: 在直线  $\sqrt{2}x \pm \sqrt{3}y = 0$  上可导, 在复平面内处处不解析。

(3)  $f(z) = z^2 \bar{z}$ ,  $f(z) = (x^3 + xy^2) + i(x^2y + y^3)$ , 则  $u=x^3 + xy^2$ ,  $v=x^2y + y^3$ ,

$$\frac{\partial u}{\partial x} = 3x^2 + y^2, \frac{\partial v}{\partial y} = x^2 + 3y^2, \frac{\partial u}{\partial y} = 2xy, \frac{\partial v}{\partial x} = 2xy, \text{ 令 } \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x} \text{ 得,}$$

$y = \pm x$ ,  $x=0$ ,  $y=0$ , 即: 函数仅在直线  $y = \pm x$ 、实轴和虚轴上满足 C-R 方程,

该函数在这四条直线上可导，在复平面内处处不解析。

3. 验证函数  $f(z) = \sin x \cosh y + i \cos x \sinh y$  在复平面上解析，并求其导数。

解：  $u = \sin x \cosh y, v = \cos x \sinh y$ ,

$$\frac{\partial u}{\partial x} = \cos x \cosh y, \frac{\partial v}{\partial y} = \cos x \cosh y, \frac{\partial u}{\partial y} = \sin x \sinh y, \frac{\partial v}{\partial x} = -\sin x \sinh y,$$

即：  $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$ ，所以函数在复平面上解析。

$$f'(z) = \cos x \cosh y - i \sin x \sinh y$$

4. 设函数  $f(z) = my^3 + nx^2y + i(x^3 + Lxy^2)$  是复平面内解析函数，求  $L, m, n$  的值。

解：  $u = my^3 + nx^2y, v = x^3 + Lxy^2$ ,

$$\frac{\partial u}{\partial x} = 2nxy, \frac{\partial v}{\partial y} = 2Lxy, \frac{\partial u}{\partial y} = 3my^2 + nx^2, \frac{\partial v}{\partial x} = 3x^2 + Ly^2$$

$$\text{由 } \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x} \text{ 得,}$$

$$L = -3, m = 1, n = -3$$

5. 设函数  $f(z) = u + iv$  在区域  $D$  内解析，证明：如果  $f(z)$  满足下列条件之一，那么它在  $D$  内为常数。

(1)  $\overline{f(z)}$  解析；(2)  $2u + 3v = 1$ ；(3)  $|f(z)|$  在  $D$  内是一个常数。

证明：关键证明  $u, v$  的一阶偏导数皆为 0。

(1)  $\overline{f(z)} = u - iv$ ，因其解析，故由柯西-黎曼方程得

$$u_x = -v_y, u_y = v_x \text{ ----- (1)}$$

而由  $f(z)$  的解析性，又有  $u_x = v_y, u_y = -v_x$  ----- (2)

由 (1)、(2) 知， $u_x = u_y = v_y = v_x = 0$ ，因此  $u \equiv c_1, v \equiv c_2$ ，即

$f(z) \equiv c_1 + ic_2$  为常数

(2) 同前面一样， $2u + 3v = 1$  两端分别对  $x, y$  求偏导数，得  $2u_x + 3v_x = 0, 2u_y + 3v_y = 0$

考虑到柯西-黎曼方程  $u_x = v_y, u_y = -v_x$ ，仍有  $u_x = u_y = v_y = v_x = 0$ ，证毕。

(3) 由已知,  $|f(z)|^2 = u^2 + v^2 \equiv c_0$  为常数, 等式两端分别对  $x, y$  求偏导数, 得

$$2uu_x + 2vv_x = 0,$$

$$2uu_y + 2vv_y = 0, \text{-----} (1)$$

$$\text{因 } f(z) \text{ 解析, 所以又有 } u_x = v_y, u_y = -v_x \text{-----} (2)$$

说明  $u, v$  皆与  $x, y$  无关, 因而为常数, 从而  $f(z)$  也为常数。

6. 证明: 若  $f(z)$  解析, 则有  $(\frac{\partial}{\partial x}|f(z)|)^2 + (\frac{\partial}{\partial y}|f(z)|)^2 = |f'(z)|^2$

证明: 由柯西-黎曼方程知, 左端  $(\frac{\partial}{\partial x}\sqrt{u^2 + v^2})^2 + (\frac{\partial}{\partial y}\sqrt{u^2 + v^2})^2$

$$= (\frac{uu_x + vv_x}{\sqrt{u^2 + v^2}})^2 + (\frac{uu_y + vv_y}{\sqrt{u^2 + v^2}})^2 = \frac{(uu_x + vv_x)^2 + (uv_x - vu_x)^2}{u^2 + v^2}$$

$$= \frac{u^2(u_x + v_x)^2 + v^2(u_x + v_x)^2}{u^2 + v^2} = (u_x + v_x)^2 = |u_x + iv_x|^2 = |f'(z)|^2 = \text{右端, 证毕。}$$

#### 第四次作业

教学内容: 2.2 初等函数及其解析性 2.3 解析函数与调和函数的关系

1. 填空题

(1)  $\exp\left(\frac{2-\pi i}{3}\right) = \underline{\hspace{2cm}}$

(2)  $(e^i)^i = \underline{\hspace{2cm}};$

(3)  $\text{Ln}(-3+4i) = \underline{\hspace{2cm}};$

(4)  $\ln(ie) = \underline{\hspace{2cm}};$

(5)  $\ln e^i = \underline{\hspace{2cm}}.$

解: (1)  $\exp\left(\frac{2-\pi i}{3}\right) = e^{\frac{2}{3}} \left[ \cos\left(-\frac{\pi}{3}\right) + i \sin\left(-\frac{\pi}{3}\right) \right] = e^{\frac{2}{3}} \left( \frac{1}{2} - i \frac{\sqrt{3}}{2} \right)$

(2)  $\text{Lne}^i = i(1+2k\pi) \quad k=0, \pm 1, \text{等},$

$$(e^i)^i = e^{iLn e^i} = e^{-(1+2k\pi)} \quad k=0, \pm 1, \text{等}$$

$$(3) \quad Ln(-3+4i) = \ln|-3+4i| + i\left(\pi - \arctan \frac{4}{3} + 2k\pi\right)$$

$$= \ln 5 + i\left(\pi - \arctan \frac{4}{3} + 2k\pi\right) \quad k=0, \pm 1, \text{等} \quad (2) \quad \ln(ie) = \ln|ie| + i\frac{\pi}{2} = 1 + i\frac{\pi}{2}$$

$$(4) \quad \ln(ie) = \ln|ie| + i\frac{\pi}{2} = 1 + i\frac{\pi}{2}$$

$$(5) \quad e^i = \cos 1 + i \sin 1, \quad \ln(e^i) = \ln|e^i| + i = i$$

2 求下列各式的值

$$(1) \quad 3^i; \quad (2) \quad (1+i)^i; \quad (3) \quad \sin(1+2i); \quad (4) \quad |\cos z|^2$$

$$\text{解: } (1) \quad 3^i = e^{iLn 3} = e^{i(\ln 3 + i2k\pi)} = e^{-2k\pi - i\ln 3} \quad k=0, \pm 1, \text{等}$$

$$(2) \quad (1+i)^i = e^{iLn(1+i)} = e^{i\left[\ln\sqrt{2} + i\left(\frac{\pi}{4} + 2k\pi\right)\right]} = e^{-\left(\frac{\pi}{4} + 2k\pi\right) + i\ln\sqrt{2}} \quad k=0, \pm 1, \text{等}$$

$$\begin{aligned} (3) \quad \sin(1+2i) &= \frac{e^{i(1+2i)} - e^{-i(1+2i)}}{2i} = \frac{e^{-2+i} - e^{2-i}}{2i} \\ &= \frac{(e^{-2} - e^2)\cos 1 + i(e^{-2} + e^2)\sin 1}{2i} \\ &= \frac{(e^{-2} + e^2)\sin 1 - i(e^{-2} - e^2)\cos 1}{2} \end{aligned}$$

$$(4) \quad \cos z = \cos(x+iy) = \cos x \cos iy - \sin x \sin iy = \cos x \cosh y - i \sin x \sinh y,$$

$$\begin{aligned} |\cos z|^2 &= (\cos x \cosh y)^2 + (\sin x \sinh y)^2 \\ &= \cos^2 x (1 + \sinh^2 y) + (1 - \cos^2 x) \sinh^2 y \\ &= \cos^2 x + \sinh^2 y \end{aligned}$$

3. 设  $z = re^{i\theta}$  求  $\operatorname{Re}[Ln(z-1)]$

$$\text{解: } Ln(z-1) = \ln|z-1| + i[\arg(z-1) + 2k\pi] \text{ 因此}$$

$$\operatorname{Re}[Ln(z-1)] = \ln|z-1| = \ln \sqrt{(r \cos \theta - 1)^2 + (r \sin \theta)^2} = \frac{1}{2} \ln(1 - 2r \cos \theta + r^2)$$

4. 解下列方程:

$$(1) e^x - 1 - \sqrt{3}i = 0; (2) \ln z = 2 - \frac{\pi}{6}i; (3) \cos z = 0; (4) \sin z + \cos z = 0$$

解: (1)  $e^x = 1 + \sqrt{3}i$ ,

$$z = \operatorname{Ln}(1 + \sqrt{3}i) = \ln 2 + i\left(\frac{\pi}{3} + 2k\pi\right) \quad k = 0, \pm 1, \text{等}$$

$$(2) z = e^{2 - \frac{\pi}{6}i} = e^2 \left( \cos \frac{\pi}{6} - i \sin \frac{\pi}{6} \right) = e^2 \left( \frac{\sqrt{3}}{2} - \frac{i}{2} \right)$$

$$(3) \cos z = \frac{e^{iz} + e^{-iz}}{2} = 0, \quad e^{i2z} = -1,$$

$$i2z = \operatorname{Ln}(-1) = i(\pi + 2k\pi)$$

$$z = \frac{\pi}{2} + k\pi \quad (k = 0, \pm 1, \text{等})$$

$$(4) \text{ 由于 } \sin z = -\cos z, \frac{e^{iz} - e^{-iz}}{2i} = \frac{-1}{2}(e^{iz} - e^{-iz}) \text{ 故}$$

$$e^{2iz} - 1 = -i(e^{2iz} + 1) \quad e^{2iz} = \frac{1-i}{1+i}$$

$$z = \frac{1}{2i} \operatorname{Ln}\left(\frac{1-i}{1+i}\right) = \frac{1}{2i} \operatorname{Ln}(-i) = \frac{1}{2i} [\ln|-i| + i(\arg(-i) + 2k\pi)] = \left(k - \frac{1}{4}\right)\pi, k = 0, \pm 1, \dots$$

5. 证明下列各式:

$$(1) \cos iz = \cosh z$$

$$\text{证明: } \cos iz = \frac{e^{iiz} + e^{-iiz}}{2} = \frac{e^z + e^{-z}}{2} = \cosh z.$$

$$(2) \cosh^2 z - \sinh^2 z = 1;$$

$$\text{证明: } \cosh^2 z - \sinh^2 z = \left(\frac{e^z + e^{-z}}{2}\right)^2 - \left(\frac{e^z - e^{-z}}{2}\right)^2 = 1.$$

6. 由下列各已知调和函数求解析函数  $f(z) = u + iv$ :

$$(1) u = (x - y)(x^2 + 4xy + y^2);$$

解: 则

$$\mu_x = 3x^2 + 6xy - 3y^2, \mu_y = 3x^2 - 6xy - 3y^2,$$

$$f'(z) = \mu_x - i\mu_y = 3x^2 + 6xy - 3y^2 - i(3x^2 - 6xy - 3y^2) = 3(1-i)z^2,$$

$$\text{故 } f(z) = (1-i)z^3 + ic, c \in R$$

$$(2) \quad v = \arctan \frac{y}{x}, x > 0;$$

$$f'(z) = v_y + i v_x = \frac{x}{x^2 + y^2} + i \frac{-y}{x^2 + y^2} = \frac{x - iy}{x^2 + y^2} = \frac{\bar{z}}{z\bar{z}} = \frac{1}{z}, \text{ 故 } f(z) = \ln z + c, c \in R$$

$$(3) \quad v = \frac{y}{x^2 + y^2}, f(2) = 0.$$

$$f'(z) = \mu_x + i v_x = \frac{x^2 - y^2}{(x^2 + y^2)^2} - i \frac{2xy}{(x^2 + y^2)^2} = \left(\frac{\bar{z}}{z\bar{z}}\right)^2 = \frac{1}{z^2}, \text{ 故 } f(z) = \frac{-1}{z} + c, c \in R$$

$$\text{由 } f(2) = 0 \text{ 得, } c = \frac{1}{2} \text{ 故 } f(z) = \frac{-1}{z} + \frac{1}{2}, c \in R$$

7. 设  $u(x, y) = e^{px} \sin y$ , 求  $p$  的值使  $v(x, y)$  为调和函数, 并求出解析函数  $f(z) = u + iv$ 。

$$\text{解: } \frac{\partial u}{\partial x} = p e^{px} \sin y, \quad \frac{\partial u}{\partial y} = e^{px} \cos y, \quad \frac{\partial^2 u}{\partial x^2} = p^2 e^{px} \sin y, \quad \frac{\partial^2 u}{\partial y^2} = -e^{px} \sin y,$$

由拉普拉斯方程知  $p = \pm 1$

当  $p = 1$  时,

$$u(x, y) = e^x \sin y$$

$$\frac{\partial v}{\partial y} = \frac{\partial u}{\partial x} = e^x \sin y$$

$$v = \int e^x \sin y dy = -e^x \cos y + g(x)$$

$$\frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y} \Rightarrow g(x) = C$$

$$f(z) = e^x \sin y + i(-e^x \cos y + C)$$

当  $p = -1$  时,

$$u(x, y) = e^{-x} \sin y$$

$$\frac{\partial v}{\partial y} = \frac{\partial u}{\partial x} = -e^{-x} \sin y$$

$$v = \int -e^{-x} \sin y dy = e^{-x} \cos y + g(x)$$

$$\frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y} \Rightarrow g(x) = C$$

$$f(z) = e^{-x} \sin y + i(e^{-x} \cos y + C)$$

8. 已知,  $u + v = x^2 - y^2 + 2xy - 5x - 5y$  试确定解析函数  $f(z) = u + iv$

解：首先，等式两边分别对  $x, y$  求偏导数，得

$$\mu_x + v_x = 2x + 2y - 5$$

$$\mu_y + v_y = 2x - 2y - 5$$

联立 C-R 方程解得

$$\mu_x = 2x - 5, \mu_y = -2y ;$$

对  $\mu_x$  积分，得  $\mu = x^2 - 5x + c(y)$ ，带入  $\mu_y$  中，

$$\text{得 } c'(y) = -2y, c(y) = -y^2 + c_0$$

$$\mu = x^2 - 5x + c_0 - y^2$$

$$v = 2yx - 5y - c_0$$

$$\text{故 } f(z) = u + iv = z^2 - 5z + c_0 - c_0 i$$

$$f(z) = u + iv = z^2 - 5z + c_0 - c_0 i$$
